

## ABSTRACT

The invention relates to a windshield wiper device, in particular for a motor vehicle, comprising a securing part (10), which is used to secure a wiper arm to a wiper shaft (13). Manufacturing tolerances in the windshield wiper device, in particular in the wiper arms and the vehicle body, lead to a deviation of the actual position of the wiper arm from its target position. The aim of the invention is balancing the manufacturing tolerances in the region of the wiper arm. According to the invention, the position of the wiper arm can be adjusted in a transverse manner in relation to the wiper shaft (13) by means of the securing part (10).
